

## Ceiling Lattice – Ellipse Installation Instructions

**1.** Pop the components out of the panel and sort into pairs. Lay out the pairs from largest to smallest.

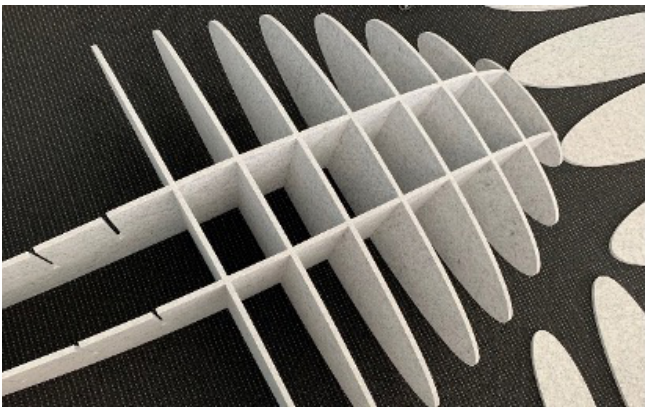

**2.** Take the longest pieces (central panels) and lay them out side by side. Remove the slot holders as pictured.

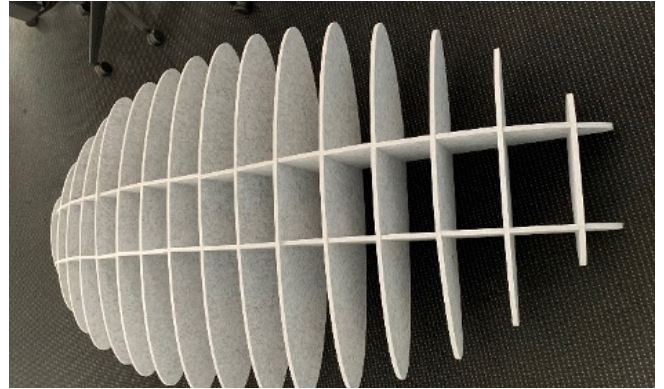

**3.** Take the longest ellipse, remove the slot holders as pictured. Count in 8 slots from the end and insert the longest ellipse into both central panels (as pictured)

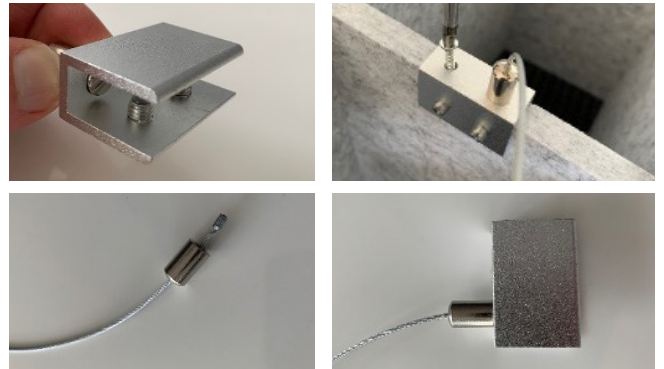

**4.** Continue to insert the ellipse's from largest to smallest moving out from the middle to the end of the central panels.

**5.** Repeat at the bottom of the panel into the floor if required.

**6.** To install on the ceiling: Count in from the outside of the central panels to the 5th ellipse. Attach the panel clamp to the central panel in between the 5th and 6th ellipse as shown. Repeat on the opposite central panel until 4 clamps and wires are fixed.

**7.** Measure the distance between the clamps and screw the ceiling mounts into the ceiling at the same dimensions. Ensure the fixing is adequate to hold the weight of the lattice.

**8.** Feed the wire through the ceiling cap and through the gap in the side of the ceiling mount, pulling the wire through to the approximate length you need. Screw the ceiling cap into the ceiling mount. Adjust the length of the wires to ensure the panel sits level. Cut the wire to length.
